

FACT: Over 3 million people in the United States have an amputation.

Prosthetic devices or artificial limbs have changed in design considerably over the years. Options range from a simple design to bionic technology. A lower extremity prosthesis consists of a socket, prosthetic components and an optional cosmetic covering. The socket is custom-made and fits over the residual limb. The components can be of carbon fiber, titanium or other materials and comprise the prosthetic knee, ankle, and foot. An individual with an amputation has multiple choices of prosthetic components based on their age, ability and activity.

Prosthetic devices are covered by health insurance and as with all prescription items you have the choice of where to obtain your prosthesis within your health insurance network.

Are you satisfied with the fit and function of your prosthesis? Are you interested in the options available to you? Please call and schedule an evaluation.
